ODOO DEV TIP:

UNDERSTAND READONLY AT MODEL & VIEW LEVEL

1.

In Python (models.py)

- Setting `readonly=True` makes the field uneditable at the model level.
- 🔒 It applies across all views and blocks ORM updates unless explicitly overridden.
- code :
`field_name = fields.char(string = "Name", readonly =True)`

2.

In xml(views)

- Using `readonly="1"` restricts the field only in that specific view.
- code :
`<field_name = "field_name" readonly="1" />`
